

Social Mood Matcher - Project Report

Introduction:

Social Mood Matcher is a web-based system designed to analyze the interests, mood, and personality traits of users and match them with suitable social groups, career suggestions, or learning opportunities. The system collects responses through questionnaires and analyzes the data to generate personalized recommendations.

Objectives:

- To identify user interests and personality traits.
- To analyze social behavior and mood patterns.
- To suggest suitable careers, courses, or social activities.
- To help students make better academic and career decisions.

Technologies Used:

- Frontend: HTML, CSS, JavaScript
- Backend: Python / Node.js (example implementation)
- Database: MySQL or Firebase
- Platform: Web Application

Methodology:

1. User Registration and Login.
2. Questionnaire to collect personality and interest data.
3. Data processing using predefined algorithms.
4. Matching the user responses with suitable recommendations.
5. Displaying the results through a user dashboard.

Advantages:

- Helps students identify their strengths and interests.
- Provides career and learning suggestions.
- Easy to use web-based interface.
- Improves decision-making for students.

Conclusion:

The Social Mood Matcher system provides an intelligent way to guide students by analyzing their interests and social behavior. By using a simple questionnaire and data analysis, the system can suggest suitable career paths and activities, helping users make informed decisions about their future.
